Flowering; Transcription regulation; Activator; Developmental protein; Nuclear protein; DNA-binding; Coiled coil; Polymorphism.
FUNCTION: Probable transcription factor involved in the genetic control of flower development. Is required for normal development of petals and stamens in the wild-type flower. Forms an heterodimer with PISTILIATA that is required for autoregulation of both AR3 and PI genes. AP3/PI heterodimer interacts with APETALA. or SEPALARA3 to form a ternary complex that could be responsible for the regulation of the genes involved in the flower
                                                                                                                                                                                                                              -i- SUBCELLUIAR LOCATION: Nuclear.
-i- TISSUB SPECIFICITY: Expressed in petals and stamens.
-i- TISSUB SPECIFICITY: Expressed in petals and stamens.
-i- INDUCTION: Positively requilated by the meristem identity proteins APETALAI and LEAFY with the cooperation of UFO.
-i- MISCELLANBONG: Matations in AP3 cause transformation of petals into sepals and stamina into carpels.
-i- SIMILARITY: BELONGS TO THE MADS DOMAIN FAMILY OF TRANSCRIPTION
                                                                                                                                                                    \rm SUBUNI\bar{T}_1: Forms an heterodimer with PISTILLATA, capable of binding to CArG-box sequences. AP3/PI heterodimer binds AP1 or SEP3 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Corsacalla-1).

```
The invention relates to a peptide conjugate having the formula:

(R-X)n-peptide where n = 1-10; X = C=0, when the R-X group is attached to the N-terminus of the peptide, or a side chain of the peptide where the functional group of the side chain is NH2 or OH; or X = O or NH, when the R-X group is attached to the C-terminus of the peptide, or a side chain in northonal group is or COMH2; and R = 2-18C alkyl or alkoxy, 2-14C alkylenyl containing one or COMH2; and R = 2-18C alkyl or alkoxy, 2-14C alkylenyl containing one or conventioned with a 1-5C straight or branched chain alkyl group, phenyl optionally monosubstituted with a 1-5C straight or branched chain alkyl group, or benzyl. The peptides Aba37001-B37058 represent analogues of the peptide portion of the conjugate. The peptides represent analogues of the peptide portion of the conjugate. The peptides conjugate is useful for modulating apoptosis in the cells of a subject, or for reversing B cell lymphoma/laukemia 2 (BC1-2) mediated blockage of apoptosis in cancer cells. It is also useful for inhibiting BC1-2 cunction. In particular, the peptide conjugate is useful for treating a subject afflicted with a cancer characterized by cancer cells that express BC1-2. The cancer includes prostate, colorectal, gastric, conspused is also useful for treating a subject and non-small lung, renal or thyroid cancers, neuroblastoma, melanoma, or conjugate is also useful for treating disorders characterized by concer cells that conjugate is anonytes a conjugate is also useful for treating disorders characterized by increased anonytes or members a group of the conjugate is a subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cytostatic; neuroprotective; anti-HIV; virucide; cerebroprotective; cardiant; Bol-2 superfamily; BH3 domain; cell death agonist; Bad; apoptosis modulation; B cell lymphoma/leukemia 2; cancer; prostate; colorectal; gastric; non-small lung; renal; thyroid; neuroblastoma, melanoma; lymphocytic leukemia; neurodegenerative disorder; AIDS;
              New peptide conjugates for modulating apoptosis or for inhibiting cell lymphoma/leukemia 2 (Bcl-2) function, especially useful for treating neurodegenerative disorders, stroke, or cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               increased apoptosis, e.g. neurodegenerative disorders, acquired immunodeficiency syndrome (AIDS), stroke or myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Length 28;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              100.0%; Score 148; DB 21;

The invention relates to a peptide conjugate having the formula:

(R.X)n peptide where n = 1-10; X = C=0, when the R-X group is attached to the N-terminus of the peptide, or a side chain of the peptide where to the N-terminus of the peptide where to the N-terminus of the peptide where the functional group of the side chain is NHZ or OH; or X = O or NH, when the R-X group is attached to the C-terminus of the peptide, or a side chain functional group is COCH or CONHZ; and R = 2-18C alkyl or alkoxy, 2-14C alkylenyl containing one or two double bonds, cyclobutyl, cyclopentyl, cyclobexyl optionally monosubstituted with a 1-5C straight or branched chain alkyl group, or benzyl. The peptides ABB37001-B3708 represent examples to phenyl optionally monosubstituted with a 1-5C straight or branched chain alkyl group, or benzyl. The peptides corresponding to amino acids 72-97 of the peptide portion of the conjugate. The peptide conjugate is useful for modulating apoptosis in the cells of a subject, or for reversing B cell lymphoma/leukemia 2 (Bcl-2), mediated blockage of apoptosis in cancer cells. It is also useful for inhibiting Bcl-2 function. In particular, the peptide conjugate is useful for treating a subject afflited with a cancer characterized by cancer collinger or cancer characterized by cancer characterized by cancer characterized by cancer characterized by cancer characterized by cancer characterized by cancer characterized by cancer characterized by cancer characterized by cancer characterized by cancer conjugate is also useful for treating disorders, acquired conjugate is also useful for treating disorders characterized by increased apoptosis, e.g. neurodegenerative disorders, acquired immunodeficiency syndrome (AIDS), stroke or myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Bcl-2. The cancer includes prostate, colorectal,

```
The invention relates to a peptide conjugate having the formula:

(R-X)n-peptide where n = 1-10; X = C=0, when the R-X group is attached to the N-terminus of the peptide, or a side chain of the peptide where the functional group of the side chain is NH2 or OH; or X = 0 or NH, when the R-X group is attached to the C-terminus of the peptide, or a side chain in NH2 or OH; or X = 0 or NH, or CONH2; and R = 2-18C alkyl or alexy, 2-14C alkylenyl containing one or convent; and R = 2-18C alkyl or alexy, 2-14C alkylenyl containing one or two double bonds, cyclobutyl, cyclopentyl, cyclohexyl optionally monosubstituted with a 1-5C straight or branched chain alkyl group, phenyl optionally monosubstituted with a 1-5C straight or branched chain alkyl group, or benzyl. The peptides Abaly1001-B37058 represent analogues of the peptide portion of the conjugate. The peptides represent analogues of the peptide portion of the conjugate. The peptides conjugate is useful for modulating apoptosis in the cells of a subject, or for reversing B cell lymphomal-leukemla 2 (BC1-2)-mediated blockage of reversing B cell lymphomal-leukemla 2 (BC1-2)-mediated blockage of apoptosis in cancer cells. It is also useful for inhibiting BC1-2 function. In particular, the peptide conjugate is useful for treating a subject afflicted with a cancer celased by cancer cells that contains and subject afflicted with a cancer celased by cancer cells that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            non-small lung, renal or thyroid cancers, neuroblastoma, melanoma, or acute or chronic lymphocytic and non-lymphocytic leukemia. The peptide
                                                                                                                                                                                                                                                                                                                                                      New peptide conjugates for modulating apoptosis or for inhibiting B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          increased apoptosis, e.g. neurodegenerative disorders, acquired immunodeficiency syndrome (AIDS), stroke or myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 conjugate is also useful for treating disorders characterized by
                                                                                                                                                                                                                                                                                                                                                                                          cell lymphoma/leukemia 2 (Bcl-2) function, especially useful for
treating neurodegenerative disorders, stroke, or cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 18; Page 17; 74pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   express
       The invention relates to a peptide conjugate having the formula:

(R-X)n-peptide where n = 1-10; X = C=0, when the R-X group is attached to the Netherland of the peptide where to the N-terminus of the peptide, or a side chain of the peptide where the functional group is attached to the C-terminus of the peptide, or a side chain is NH2 or OH; or X = 0 or NH, when the R-X group is attached to the C-terminus of the peptide, or a side chain functional group is COOH or COOH of the peptide, where the side chain functional group is COOH or COOH of the peptide alkoxy, cyclopentyl, cyclohexyl optionally monosubstituted with a 1-5C straight or branched chain alkyl group, or benzyl. The peptides A-B37001-B37058 represent examples of the peptide portion of the conjugate. The peptides represent analogues of the peptide portion of the conjugate. The peptide conjugate is useful for modulating apoptosis in the cells of a subject, or for reversing B cell lymphoma/leukemia 2 (BCl-2)-mediated blockage of goptosis in cancer cells of a subject of inhibiting Bcl-2 function. In particular, the peptide conjugate is useful for inhibiting a cubject afflicted with a cancer characterized by cancer cells that cancer characterized by cancer cells that chancer includes prostate, colorectal, gastric, or consensal lung, remain or thyroid cancers, neuroblemia, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   acute or chronic lymphocytic and non-lymphocytic leukemia. The peptide conjugate is also useful for treating disorders characterized by increased apoptosis, e.g. neurodegenerative disorders, acquired immunodeficiency syndrome (AIDS), stroke or myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a peptide conjugate having the formula:

(R-X)n-peptide where n = 1-10; X = C=0, when the R-X group is attached to the N-terminus of the peptide, or a side chain of the peptide where the functional group of the side chain is NH2 or OH; or X = O OH NH, when the R-X group is attached to the C-terminus of the peptide, or a side chain of the peptide, where the side chain functional group is COOH or CONH2; and R = 2-18C alkyl or alkylenyl of the peptide, where the side chain functional group is COOH or CONH2; and R = 2-18C alkyl or alkylenyl optionally monsubstituted with a 1-5C straight or branched chain alkyl group, or benzyl. The peptides AB37001-B37058 represent analogues of the peptide portion of the conjugate. The peptides represent analogues of the peptide portion of the conjugate. The peptides colds 72-97 of the BH3 domain of the conjugate. The peptide conjugate is useful for modulating apolyosis in the cells of a subject, or for reversing B cell lymphoma/leukemia 2 (BCl-2)-mediated blockage of represent else, it is also useful for inhibiting actoring subject afflicted with a cancer characterized by cancer cells, that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             express Bc1-2. The cancer includes prostate, colorectal, gastric, non-small lung, renal or thyroid cancers, neuroblastoma, melanoma, or acute or chronic lymphocytic and non-lymphocytic leukemia. The peptide conjugate is also useful for treating disorders characterized by increased apoptosis, e.g. neurodegenerative disorders, acquired immunodeficiency syndrome (AIDS), stroke or myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Bcl-XL/Bcl-2 associated cell death regulator; BAD; mutant; apoptosis; immunostimulant; neuroprotective; nootropic; antilschaemic; vulnerary; cytostatic; antiviral; antiarthritic; antinflammatory; wound healing; immunosuppressive; apoptosis inducer; apoptosis inhibitor; cancer; immunodeficiency disease; neurodegenerative disease; viral infection; ischaemic cell death; reperfusion cell death; arthritis; infertility; lymphoproliferative condition; inflammation; autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                        m
                                                                                                                                                                                                                                                                                      New peptide conjugates for modulating apoptosis or for inhibiting cell lymphoma/leukemia 2 (Bcl-2) function, especially useful for treating neurodegenerative disorders, stroke, or cancer

The present invention describes an isolated or synthetic polypeptide (1) comprising a less than full length amino acid sequence of a mutant Call XIAD-12 associated cell death regulator polypeptide (BAD) or its fragment, which contains amino acid substitutions at Sarl18 of a human BAD, Ser155 of a murine BAD, (longer murine BAD) or Ser113 of a murine BAD (softer murine BAD) or Ser13 of a murine BAD, contropic, antischaemic, vulnerary, cytostatic, antiviral, neuroprotective, notizopic, antischaemic, vulnerary, cytostatic, antiviral, can be used as an apoptosis inducer or inhibitor. BAD polypeptides and colyncleotides can be used for screening candidate compounds and contropic or inhibiting apoptosis in a cell. Candidate compounds inducing or inhibiting apoptosis in a cell. Candidate compounds inducing or inhibiting apoptosis in a cell. Candidate compounds inducing or inhibiting apoptosis in a cell. Candidate compounds inmunodeficlency diseases, neurodegenerative diseases, ischaemic cell death, wound healing, cancer, viral infections, lymphoproliferative conditions, arthritis, infertility, inflammation and cautoimmune diseases. The present sequence represents a specifically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Epitope, murine; bcl-x(L)/bcl-2 associated death promoter; Bad, stroke, polypeptide; bcl-x; cell death; regulate; BH1; BH2; apoptotic cell death; cytokine deprivation; IL-3 dependent cell line; immunodeficiency; AIDS;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The present invention describes mutant BAD (BCL-XL/BCL-2 associated cell death regulator) proteins, having an amino acid other than Ser at position 112 and/or 136, relative to the murine BAD 504 as asquence. The present sequence is the murine BAD protein. Also described are: (1) fragments of mutant BAD protein. Also described are: (1) fusion proteins of mutant BAD with a heterologous polypeptide that increases intracellular delivery. Mutant BAD proteins are used to treat or prevent diseases associated with reduced apoptosis, e.g. cancer, viral infection, lymphoproliferation, arthritis, infertility, cancer, viral inflammation and autoimmune disease. Polynucleotide sequences encoding inflammation and autoimmune disease. Polynucleotide sequences encoding transgenic animals for use as disease models or in drug screening. BAD proteins can be used a specified Ser are used to screen for enhancers and inhibitors of serine-phosphatase. Inhibitors are potentially useful in treatment of excessive apoptosis such as ALDS, neurodegeneration, aging or ischaemic cell death. The apoptotic status of cells is certained by measuring relative amounts of phosphorylated BAD, by usual immunoassays. Mutant BAD proteins have phosphorylated BAD, by usual immunoassays. Mutant BAD which can become phosphated on the specified Ser, forming a product that does not content of phosphorylated on the specified Ser, forming a product that does not content of proteins in the cytosol, thus promoting cell survival. The mutants with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Murine; mouse; BCL-XL/BCL-2 associated cell death regulator; BAD protein; serine substituted mutant; apoptosis; cancer; viral infection.
                                                                                                                                                                                                                                                                                                                                                                   New mutant BAD polypeptide with phosphorylatable serine replaced -useful for, e.g. treating reduced apoptosis such as in cancer or viral infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   93.2%; Score 138; DB 19; Length 204; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents the murine bcl-x(L)/bcl-2 associated death promoter (Bad) gene. Bad is a 22.1 kp protein which interacts with cl-2 and bcl-x proteins and regulates cell death. It has homology to the bcl-2-related family clustered in the BHI and BH2 domain. Bad has been found to hybridise to bcl-x(L) and bcl-2 in yeast two-hybrid seasys and in vivo in mammalian cells. Overexpressed Bad counters the death inhibitory activity of bcl-x(L), but is much less effective at countering the death inhibitory activity of bcl-x(L), and its also counters the accelerate apoptoric cell death induced by cytokine deprivation in an IL-3 dependent cell line expressing bcl-x(L), and its also counters the death repressor activity of bcl-x(L), and its also counters the cell normal and propressing bcl-x(L). Bad competes with Bax for binding to bcl-2 or bcl-x(L) to form heterodimers. Such agents may be used to treat neurodegenerative diseases, immunodeficiency diseases,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Murine; mouse; BCL-XL/BCL-2 associated cell death regulator; BAD protein; serine substituted mutant; apoptosis; cancer; viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The present invention describes mutant BAD (BCL-XI/BCL-2 associated cell death regulator) proteins, having an amino acid other than Ser at position 112 and/or 136, relative to the mutant BAD 914 as sequence. The present sequence represents a mutant BAD protein. Also described are: (1) fragments of mutant BAD protein. Also described are: (1) fragments of mutant BAD protein able to decrease cell viability; (2) increases intracellular delivery. Mutant BAD proteins are used to treat or prevent diseases associated with reduced apoptosis, e.g. cancer, viral infection, Imphoproliferation, arthritis, infertility, inflammation and autoimmune disease. Polymotelectide sequences encoding mutant BAD proteins can be used similarly by gene therapy or to produce transgenic animals for use as disease models or in drug screening. BAD proteins phosphorylated as sequences. Inhibitors of serime-phosphatase. Inhibitors are potentially useful in treatment of excessive apoptosis such as AIDS, neurodegeneration, altoritated BAD, by usual immunoassays. Mutant BAD proteins have phosphorylated bAD, by usual immunoassays. Mutant BAD proteins have phosphorylated on the specified Ser, forming a product that does not neterodimerise with BCL-2 or BCL-XL but instead binds to 14-3-3 family serimined by measuring relative amounts of phosphorylated or neterodimerise with BCL-2 or BCL-XL but instead binds to 14-3-3 family serimined by activity thus will survival. The mutants with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    BCL-XL/BCL-2 associated cell death regulator; BAD protein;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes mutant BAD (BCL-XL/BCL-2 associated cell death regulator) proteins, having an amino acid other than Ser at position 112 and/cur 136, relative to the murine BAD 904 as sequence. The position 112 and/cur 136, relative to the murine BAD 904 as sequence. The present sequence represents a mutant BAD protein. Also described are: (1) fragments of mutant BAD with a heterologous polypeptide that channesses intracellular delivery. Mutant BAD proteins are used to treat or prevent diseases associated with reduced apoptosis, e.g. cancer, viral infection, lymphoproliferation, arthritis, infertility, inflammation and autoimmune disease. Polynucleotide sequences encoding mutant BAD proteins can be used similarly by gene therapy or to produce transgenic animals for use as disease. Polynucleotide sequences encoding intable animals for use as disease. Polynucleotide sequences condinibitors of serine-phosphatase. Inhibitors are potentially useful in treatment of excessive apoptosis such as AIDS, neurodegeneration, determined by measuring relative amounts of phosphorylated BAD, by usual immunoassays. Mutant BAD proteins have phosphorylated and the specified Ser, forming a product that does not phosphorylated on the specified Ser, forming a product that does not heterodimerise with BCL-XL but instead binds to 14-3-3 family ser substituted cannot bind 14-3-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .

This sequence represents a novel serine-phosphorylated protein, BAD (BC1-X1/Rc1-2 associated cell death requiator). The serine residue is phosporylated in a post-translational modification and allows binding to the 14-3-3 protein which is a signal transduction requiator.

Modulators of phosphorylated BAD, which act through inhibition/activation of a phosphoserine phosphatase, are useful for preventing/treating increased/decreased apoptosis in a cell. The increased apoptosis may result from immunodeficiency diseases, senescence, neurodegenerative disease, ischemic cell death, reperfusion cell death, infertility and wound-healing. Decreased apoptosis may result from cancer, viral infection, lymphoproliferative conditions, arthritis, infertility, infammation and autoimmune diseases. Messuring the amount of phosphorylated compared to unphosphorylated BAD polypeptide and/or total BAD in a cell is useful for determining the apoptotic state of a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       immunostimulant; neuroprotective; nootropic; antiischaemic; vuleerary; cytostatic; antiviral; antiarthritic; antiinflammatory; wound healing; immunosuppressive; apoptosis inducer; apoptosis inhibitor; cancer; immunodeficiency disease; neurodegenerative disease; viral infection; ischaemic cell death; arthritis; infection; lymphoproliferative condition; inflammation; autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Bcl-XL/Bcl-2 associated cell death regulator; BAD; mutant; apoptosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   δă
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        QQ
                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes mutant BAD (BCL-XL/BCL-2 associated cell death regulator) proteins, having an amino acid other than Ser at position 112 and/or 136, relative to the murine BAD 204 as sequence. The present sequence represents a mutant BAD protein. Also described are: (1) fragments of mutant BAD protein. Also described are: (1) fragion proteins of mutant BAD with a heterologous polypeptide that increases intracellular delivery. Mutant BAD proteins are used to treat or prevent diseases associated with reduced apoptosis, e.g. cancer, viral infection, lymphoproliferation, arthritis, infertility, inflammation and autoimmune disease. Polymuciectide sequences encoding mutant BAD proteins can be used similarly by gene therapy or to produce transpenic animals for use as disease models or in drug screening. BAD proteins phosphorylated at specified Ser are used to screen for enhancers and inhibitors of serine-phosphatase. Inhibitors are potentially useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          in treatment of excessive apoptosis such as AIDS, neurodegeneration, aging or ischaemic cell death. The apoptotic status of cells is determined by measuring relative amounts of phosphorylated and non-phosphorylated BAD, by usual immunoassays. Wutant BAD proteins have phosphorylated on the specified Ser, forming a product that does not heterodimerise with BCL-2 or BCL-XL but instead binds to 14-3-3 family proteins in the cytosol, thus promoting cell survival. The mutants with Ser substituted cannot bind 14-3-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           BAD protein; Bcl-XL/Bcl-2 associated cell death regulator; 14-3-3; serine phosphorylation; post-translational modification; apoptosis; signal transduction regulator; phosphoserine phosphatase; senescence; immunodeficiency disease; neurodegenerative disease; infertility; cancer, viral infection; lymphoproliferative condition; arthritis;

The present invention describes a method (M1) for inducing apoptosis in a cell infected with herpes simplex virus (HSV), which comprises administering to the cell, a composition having an agent that inhibits phosphorylation of pro-apoptotic polypeptide BAD by HSV US3. Also described is a method (M2) for treating a patient infected with HSV, by administering to the patient, a composition comprising a peptide comprising a sequence of 4-100 continuous amino acids of a Id8 residue amino acids sequence (see ABR39081), where the peptide comprises seril2, seril35, or seri55, or their combinations. BAD has virucide activity. M1 is useful for inducing apoptosis in a cell infected with HSV, where the cell is in a human. M2 is useful for treating a patient infected with HSV. The present sequence represents murine BAD, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Mouse; Bad-DTTR; apoptosis; cancer; spinal muscular atrophy; diphtheria toxin receptor binding domain; DTR; neoplasm; tumour; hyper-proliferation; Alzheimer's disease; neurodegenerative disorder; transient ischaemic neuronal injury; stroke; spinal cord injury;

                                                                                                                                                                                                                                                                                                                   The present invention describes an isolated or synthetic polypeptide

(1) comprising a less than full length amino acid sequence of a mutant

BL-XL/BOL-2 associated cell death regularor polypeptide (BAD) or its
fragment, which contains amino acid substitutions at Seril3 of a human

BAD, Seri55 of a murine BAD (longer murine BAD) or Seril3 of a murine

BAD (shorter murine BAD). (1) has immnostimulari, neuroprotective,
nootropic, antilnflammatory and immunosuppressive activities, and
antiarthritic, antilnflammatory and immunosuppressive activities, and
con be used as an apoptosis inducer or inhibitor. BAD polyapetides and
polynucleotides can be used for screening candidate compounds and drugs
for activity that promote cell survival or apoptosis. Other uses include
inducing or inhibiting apoptosis in a cell. Candidate compounds
inducing or inhibiting apoptosis in a cell. Candidate compounds
inducing or inhibiting apoptosis are useful in treating
immunodeficiency diseases, neurodegenerative diseases, ischaemic cell
death, reperfusion cell death, wound healing, cancer, viral infections,
lymphoproliferative conditions, arthritis, infertility, inflammation and
autoimmune diseases. The present sequence from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Murine; BAD; herpes simplex virus; HSV; US3; herpes virus; apoptosis;

Novel fusion protein for modifying apoptosis in target cell and reducing apoptosis after transient ischaemic neuronal injury, has two domains which targets protein to a cell and modifies apoptotic response of cell

Claim 4; Page 59-61; 65pp; English

The sequence represents the amino acid sequence of Bad-DTTR apoptosismodifying fusion protein comprising Bad gene sequence fused via a short individual apoptosis-modifying fusion protein is capable of binding a functional apoptosis-modifying fusion protein is capable of binding a target cell. The apoptosis-modifying fusion protein comprises at least two domains: the DTR domain, which targets the fusion protein comprises at least two domains: the DTR domain, which modifies an apoptotic response of the target cell. The fusion protein is useful for modifying target cell. The fusion protein is useful for modifying of the target cell. The fusion protein is useful for modifying to finbiting or enhancing) apoptosis in a target cell, such as neuron, improvate, cancer, neoplasm, macrophage, epithelial, stem, tumour or hyper-proliferative cell or an adipocyte. It is also useful for reducing apoptosis in a subject after transient ischemic neuronal injury.

Completion of any conditions through inhibition or enhancement of apoptotic cellular response, including neurodegenerative disorders such as Alzheimer sa disease, Huntington's disease, spinal muscular arcophy, stroke episodes and unrequiated cell growth as in tumours and various cancers. The apoptosis-modifying fusion protein can be delivered of effectively throughout the body and targeted to selective tissue and

Patent No. 5856445

GENERAL INFORMATION:

APPLICANT: KORSMEYER, STANLEY J.

TITLE OF INVENTION: SELL-XL/BCL-2 ASSOCIATED DUTANTS OF

TITLE OF INVENTION: BCL-XL/BCL-2 ASSOCIATED CELL DEATH REGULATOR

NUMBER OF SEQUENCES: 6

CORRESPONDENCE ADDRESS:

ADDRESSEE: HAFERKAMP, L.C.

STREET: 7733 FORSYTH BLVD., SUITE 1400

COUNTRY: USA

COUNTRY: USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length 204;

GENERAL INFORMATION:
APPLICANT: I.N.S.B.R.M.
TITLE OF INVENTION: Polynucleotides which are of nature B2/D+ A- and which are isolat
TITLE OF INVENTION: E.coli, and biological uses of these polynucleotides and of their PILE REPERENCE: BLANDINE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           6
                                                                                                                                                                                                                                                                                                                                             0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A.Description: aldehyde-lyase; carbon-carbon lyase
A.Pathway: aromatic amino acid biosynthesis; shikimate pathway
A.Note: first step in shikimate pathway
C.Superfamily: phospho-2-dehydro-3-deoxyheptonate aldolase
C.Keywords: aldehyde-lyase; aromatic amino acid biosynthesis; carbon-carbon lyase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          floral homeotic protein APETALA3 (AP3) - Arabidopsis thaliana
N,Alternate names: homeotic protein APETALA3; MADS-box regulatory protein AP3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

Hamner S., Arumae U., Yu L.-Y., Sun Y.-F., Saarma M., Lindholm D.;

"Functional Characterization of two splice variants of rat BAD and
their interaction with Bcl-w in sympathetic neurons.";

Mol. Cell. Neurosci. 17:87-106(2001).

-! FUNCTION: Promotes cell death. Successfully competes for the binding to Bcl-xCl, Bcl-2 and Bcl-w, thereby affecting the level of heterodimerization of these proteins with BAX. Can reverse the death repressor activity of Bcl-xCl), but not that of Bcl-2 (By similarity). Appears to act as a link between growth factor receptor signaling and the apoptotic pathways.

-! SUBGNIT: Forms heterodimers with the anti-apoptotic proteins, Bcl-xCl), Bcl-2 and Bcl-w. Also binds protein S100A10. The Ser-XIJ/Ser-137 phosphorylated form binds 14-3-3 proteins.

-! SUBCRILUTAR IOCATION: Outer mitochondrial membrane. Upon phosphorylation, locates to the cytoplasm (By similarity).
   DOMAIN: Intext BH3 domain is required by BIK, BID, BAK, BAD AND BAX for their pro-apoptotic activity and for their interaction with anti-apoptotic activity and for their interaction with anti-apoptotic members of the Bcl-2 family.

FTM: Phosphorylated on Ser-113 in response to survival stimuli. Subsequent phosphorylation on Ser-13 in response to survival stimuli. Subsequent phosphorylation on Ser-13 interaction then facilitates the phosphorylation at Ser-156, a site within the BH3 domain, leading to the release of Bcl-x(L) and the promotion of cell survival. Ser-137 is the major site of AKT/PKB phosphorylation, Ser-156 the major site of RKT/PKB phosphorylation (By
  TISSUB SPECIFICITY: Expressed in all tissues tested, including brain, liver, spleen and heart. In the brain, restricted to epithelial cells of the choroid plexus. Isoform alpha is the more
  -!- SIMILARITY: Contains 1 Bcl-2 homology 3 (BH3) domain.

  SIMILARITY: Contains 1 Bcl-2 homology 3 (BH3) Gomain.
SIMILARITY: Contains 1 Bcl-2 homology 3 (BH3) Gomain.
SIMILARITY: BELONGS TO THE BCL-2 FAMILY.
CAUTION: Ref.1 sequence differs from that shown due to frameshifts in position 64 and 91.
   phosphorylation, locates to the cytoplasm.

TISSUE SPECIFICITY: EXPRESSED IN A WIDE VARIETY OF TISSUES.

DOMAIN: Intact BH3 domain is required by BIK, BID, BAK, BAD AND
BAX for their pro-apoptotic activity and for their interaction
with anti-apoptotic members of the Bcl-2 family.

PTM: Bhosphorylated on Ser-75 in response to survival stimuli.

Subsequent phosphorylation on Ser-99 promotes heterodimerization
with 14-3-3 proteins. This interaction then facilitates the
phosphorylation at Ser-118, a site within the BH3 domain, leading
to the release of Bcl-x(L) and the promotion of cell survival.

Ser-99 is the major site of AKT/PKB phosphorylation, Ser-118 the
major site of protein kinase A (CAPK) phosphorylation (by

-!- FUNCTION: Probable transcription factor involved in the genetic control of flower development. Is required for normal development of petals and stamens in the wild-type flower. Forms an heterodimer with PISTILLARA that is required for autoregulation of both AP3 and PI genes. AP3/PI heterodimer interacts with APETALA or SEPALIARA to form a ternary complex that could be responsible for the requiation of the genes involved in the flower

The invention relates to a peptide conjugate having the formula:

(R-X)n-peptide where n = 1-10; X = C=0, when the R-X group is attached to the N-terminus of the peptide, or a side chain of the peptide where to the N-terminus of the peptide where the side chain of the peptide where the side chain of the peptide, or a side chain of the peptide, or a side chain of the peptide, where the side chain functional group is attached to the C-terminus of the peptide, or a side chain of the peptide, where the side chain functional group is COOH or CONH2; and R = 2-18C alkyl or alkoxy, 2-14C alkylenyl containing one or two double bonds, cyclobutyl, cyclopentyl, cyclohexyl optionally monosubstituted with a 1-5C straight or branched chain alkyl group, phenyl optionally monosubstituted with a 1-5C straight or branched chain alkyl group, or benzyl. The peptides ABB37001-B37058 represent analogues of the peptide portion of the conjugate. The peptides conjugate is a BC1-2 superfamily polypeptide corresponding to a mino acids 72-97 of the BH3 domain of the cell death agonist Bad. The peptide conjugate is useful for modulating apoptosis in the cells of a subject, or for reversing B cell; lymphoma/leukemia 2 (BC1-2) "mediated blockage of apoptosis in cancer characterized by cancer cells that subject afflicted with a cancer characterized by cancer cells that subject afflicted with a cancer characterized by cancer cells that cancer chronic lymphocytic and non-lymphocytic leukemia. The peptide conjugate is also useful for treating disorders, acquired conjugate is also useful for treating disorders characterized by monoulymphate is also useful for treating disorders characterized by infarction.

Conjugate is also useful for treating disorders, acquired immunodeficiency syndrome (AIDS), stroke or myocardial infarction.

The invention relates to a peptide conjugate having the formula:

(R-X)n peptide where n = 1-10; X = C=0, when the R-X group is attached to the Verminus of the peptide, or a side chain of the peptide where to the University of the peptide, or a side chain is NH2 or NH; or X = O or NH, when the R-X group is attached to the C-terminus of the peptide, or a side chain functional group is COHH; or alkoxy, 2-14C alkylenyl containing one or CONH2; and R = 2-18C alkyl or alkoxy, 2-14C alkylenyl containing one or two double bonds, cyclobutyl, cyclopentyl, cyclohexyl optionally proup, or benzyl. The peptides Aba37001-B3708 represent examples or two double portion of the conjugate. The peptides chain alkyl group, alkyl group, or benzyl. The peptides Aba37001-B3708 represent analogues of the peptide portion of the conjugate. The peptides represent analogues of the peptide portion of the conjugate. The peptides conjugate is a Bol-2 superfamily polypeptide corresponding to amino acids 7-97 of the BH3 domain of the cell death agonist Bad. The peptide conjugate is reversing B cell lumphona/leukemia 2 (Bel-2)-mediated blooky or for reversing B cell lumphona/leukemia (Bloot) in hibiting Bol-2 function. In particular, the peptide conjugate is useful for treating a subject afflicted with a cancer characterized by cancer cells the express Bol-2. The cancer characterized by cancer cells the express Bol-2. The cancer includes prostate, colorectal, gastic, consumpting the salso useful for treating disorders conjugate is also useful for treating disorders conjugate is also useful for treating disorders conjugate is acquired immunodeficiency syndrome (AIDS), stroke or myocardial infarction.

(i) comprising a less than full length amino acid sequence of a mutant fragment, which contains amino acid substitutions at Serial of a mutant fragment, which contains amino acid substitutions at Serial of a mutant BAD, Serias of a mutane BAD, or Serias of a mutane BAD, (I) has immunostimulant, neuroprotective, notropic, antistement, vulnerary, cytostatic, antivital, antisinflammatory and immunosuppressive activities, and can be used as an apoptosis inducer or inhibitor. BAD polypeptides and polyucleotides can be used for screening candidate compounds and drugs for activity that promote cell survival or apoptosis. Other uses include inducing or inhibiting apoptosis in a cell. Candidate compounds inducing or inhibiting apoptosis in a cell. Candidate compounds inducing or inhibiting apoptosis in a cell. Candidate compounds inducing or inhibiting apoptosis in a cell. Candidate compounds inducing or inhibiting apoptosis are useful in treating immunodeficiency diseases, neurodegenerative diseases, ischaemic cell death, wound healing, cancer, viral infections, lymphoproliferative conditions, arthritis, infertility, inflammation and autolimmune diseases.  This sequence represents the murine bcl-x(L)/bcl-2 associated death bcl-x bad) gene. Bad is a 22.1 kD protein which interacts with bcl-2 and bcl-x proteins and requiates cell death. It has bemology to the bcl-2-related family clustered in the Bill and BH2 domain. Bad has been found to hybridise to bcl-x(L) and bcl-2 in yeast two-hybrid assays and in vivo in mammalian cells. Overexpressed Bad counters the death inhibitory activity of Dcl-x(L), but is much less effective at countering the death inhibitory activity of bcl-x(L), but is much less effective at accelerate apoptoric cell death induced by cytokine deprivation in an IL-3 dependent cell line expressing bcl-x(L), and its also counters the death repressor activity of bcl-x(L). Bad competes with Bax for binding to bcl-2 or bcl-x(L). Bad competes with Bax for binding to bcl-2 or bcl-x(L) form heterodimers. Such agents may be used to treat neurodegenerative diseases, immunodeficiency diseases,

This sequence represents a novel serine-phosphorylated protein, BAD (BOL-XI)RAI-12 associated cell death regulator). The serine residue is phosporylated in a post-translational modification and allows binding to the 14-3-3 protein which is a signal transduction regulator.

Conformation of a phosphorylated BAD, which act through inhibition/activation of a phosphoserine phosphorylated BAD, which act through inhibition/activation of a phosphoserine phosphorylated BAD, which act through inhibition/activation of a phosphoserine phosphorylated BAD, which act through inhibition/activation of increased/decreased apoptosis in a cell. The increased apoptosis may result from immunodeficiency disease, senescence, neurodegenerative disease, ischaemic cell death, repetiusion cell death, infertility and wound-healing. Decreased apoptosis may result from cancer, viral infection, lymphoproliferative conditions, arthritis, infertility, inflammation and autoimmune diseases. Messuring the amount of phosphorylated compared to unphosphorylated BAD polypeptide and/or total BAD in a cell is useful for determining the apoptotic state of a cell.

The present invention describes a method (MI) for inducing apoptosis in a cell infected with herpes simplex virus (HSV), which comprises administering to the cell, a composition having an agent that inhibits phosphorylation of pro-apoptotic polypeptide BAD by HSV US3. Also described is a method (M2) for treating a patient infected with HSV, by administering to the patient, a composition comprising a peptide comprising a sequence of 4-100 continuous amino acids sequence (see ABRS90B1), where the peptide comprises seall2, seal13, or ser155, or their combinations. BAD has virucide activity. M is useful for inducing apoptosis in a cell infected with HSV, where the cell is in a human. M2 its useful for treating a patient infected with HSV. The present sequence represents murine BAD, which is used in the exemplification of the present invention.

Novel fusion protein for modifying apoptosis in target cell and reducing apoptosis after transient ischaemic neuronal injury, has two domains which targets protein to a cell and modifies apoptotic response of cell
```

Claim 4; Page 59-61; 65pp; English.

The sequence represents the amino acid sequence of Bad-DTTR apoptosismodifying fusion protein comprising Bad gene sequence fused via a short
linker to diphtheria toxin translocation domain (DTTR). The
linker to diphtheria toxin translocation domain (DTTR). The
linker to diphtheria toxin translocation domain (DTTR). The
linker to diphtheria toxin toxin protein is capable of binding a
located cell. The apoptosis-modifying fusion protein comprises at least
crarget cell. The BDTR domain, which targets the fusion protein to the
larget cell. The fusion protein is useful for modifying
cof the target cell. The fusion protein is useful for modifying
(inhibiting or enhancing) apoptosis in a target cell, such as neuron,
lymphocyte, cancer, neoplasm, macrophage, epithelial, stem, tumour or
hyper-proliferative cell or an adipocyte. It is also useful for reducing
apoptosis in a subject after translent ischaemic neuronal injury,
especially spinal cord injury. The fusion protein may be used to treat
various diseases and injury conditions through inhibition or enhancement
of apoptotic cellular response, including neurodegenerative disorders
such as Alzheimer's disease, Huntington's disease, spinal muscular
catrophy, stroke episodes and unequilated cell growth as in tumours and
atrophy, stroke episodes and unequilated cell growth as in tumours and
effectively throughout the body and targeted to selective tissue and

EVAMFPLRYWTALRRLC (in isoform Beta).
   -:- FUNCTION: Promotes call death. Successfully competes for the binding to Bcl-x(L), Bcl-2 and Bcl-w, thereby affecting the level of heterodimerization of these proteins with Bax. Can reverse the death repressor activity of Bcl-x(L), but not that of Bcl-2 (By similarity). Appears to act as a link between growth factor receptor signaling and the apoptotic pathways.

-!- SUBONIT: Forms heterodimers with the anti-apoptotic proteins, Bcl-x(L), Bcl-2 and Bcl-w Also binds protein SIOA10. The Ser-137 phosphorylation for mitochondrial membrane. Upon phosphorylation, locates to the cytoplasm (By similarity).
  Subsequent phosphorylation on Ser-137 promotes heterodimerization with 14-3-3 proteins. This interaction then facilitates the phosphorylation at Ser-156, a site within the BH3 domain, leading to the release of Bcl-x(L) and the promotion of cell survival. Ser-137 is the major site of AKT/PKB phosphorylation, Ser-156 the major site of protein kinase A (CAPK) phosphorylation (By
  TISSUE SPECIFICITY: Expressed in all tissues tested, including brain, liver, spleen and heart. In the brain, restricted to epithelial cells of the choroid plexus. Isoform alpha is the more

Nature 409:255-529(2001).

-!- FUNCTION: Probable transcription factor involved in the genetic control of flower development. Is required for normal development of petals and stamens in the wild-type flower. Forms an heterodimer with PISTILIAMA that is required for autoreadiation of both AP3 and PI genes. AP3/PI heterodimer interacts with APETALAI or SEPALLATA3 to form a ternary complex that could be responsible for the regulation of the genes involved in the flower

  This sequence represents the BH3 domain of mouse BAD.

The invention relates to a bc1 homology domain 3 (BH3 domain),
derived from a prosportic member of the BCL-2 family. The
BH3 polypeptide can be used in a method for promoting apoptosis in a
target cell, especially where the cell is a cencer cell a virus infected
cell or an autoantibody producing cell. The BH3 polypeptide can be used
in therapeutic compositions for treating disease including cancer, other
lymphoproliferative conditions, arthritis, inflammation, and autoimmune
diseases, which may result from the down regulation of cell death
  The invention relates to a peptide conjugate having the formula: (R-X)n-peptide where n=1-10; X=C=0, when the R-X group is attached to the N-terminus of the peptide, or a side chain of the peptide where the functional group of the side chain is NH2 or OH; or X=0 or NH, when the R-X group is attached to the C-terminus of the peptide, or a side chain functional group is C=10 or C=110 or two double bonds, cyclobutyl, cyclopentyl, cyclohexyl optionally

monosubstituted with a 1-5C straight or branched chain alkyl group,

phenyl optionally monosubstituted with a 1-5C straight or branched chain

alkyl group, or benzyl. The peptides ABB37001-B37058 represent examples

of the peptide portion of the conjugate. The peptides represent analogues

of a Bcl-2 superfamily polypeptide corresponding to amino acids 72-97 of

the BH3 domain of the cell death agonist Bad. The peptide conjugate is

useful for modulating apoptosis in the cells of a subject, or for

reversing B cell lymphoma/leukemia 2 (Bcl-2)-mediated blockage of

apoptosis in cancer cells. It is also useful for inhibiting Bcl-2

tunction. In particular, the peptide conjugate is useful for treating a

cute tafflicted with a cancer characterized by cancer cells that

express Bcl-2. The cancer includes prostate, colorectal, gastric,

non-small lung, renal or thyroid cancers, neuroblastoma, melanoma,

cute or chronic lymphocytic and non-lymphocytic leukemia. The peptide

conjugate is also useful for treating disorders characterized by

increased apoptosis, eg, neurodegenezative disorders, acquired

immunodeficiency syndrome (AIDS), stroke or myocardial infarction.
   Epitope; murine; bcl-x(L)/bcl-2 associated death promoter; Bad; stroke; polypeptide; bcl-x; cell death; regulate; BHI; BH3, appitotic cell death; cytokine deprivation; IL-3 dependent cell line; immunodeficiency; AlDS; neurodegenerative disease; senescence; ischaemia; neoplasia.
  The sequences given in AAR95155-67 represent epitopes derived from the murine bcl-x(L)/bcl-2 associated death promoter (Bad) polypeptide (see also AAR95168). Bad is a 22.1 kD protein which interacts with bcl-2 and bcl-x proteins and regulates cell death. It has homology to the bcl-2-related family clustered in the BH1 and BH2 domain. Bad has been found to hybridise to bcl-x(L) and bcl-2 in yeast two-hybrid assays and in vivo in mammalian cells. Overexpressed Bad counters the death
   Gaps
  Polynucleotide encoding bcl-x(L)/bcl-2 associated death promoter useful to treat neoplasia and apoptosis and to identify agents inhibiting its binding to bcl-z or bcl-x(L) to form heteromultimers
   bcl-x(L)/bcl-2 associated death promoter epitope, residues 138-160.

ö
inhibitory activity of bcl-x(L), but is much less effective at countering the death inhibitory activity of bcl-2. Bad expression can accelerate apoptoric cell death induced by ytokine deprivation in an IL-3 dependent cell line expressing bcl-x(L), and its also counters the death repressor activity of bcl-x(L). Bad competes with Bax for binding to bcl-x(L) and may be used to identify agents which inhibit it its binding to bcl-x(L) or bcl-x(L) to form heterodimers. Such agents may be used to treat neurodegenerative diseases, immunodeficiency diseases, e.g. AIDS,
   The invention relates to a peptide conjugate having the formula: (R-X)n-peptide where n = 1-10; X = C-O, when the R-X group is attached to the N-terminus of the peptide, or a side chain of the peptide where the functional group of the side chain is NH2 or OH; or X = O or NH; when the R-X group is attached to the C-terminus of the peptide, or a side chain of the peptide, where the side chain functional group is COOH or CONH2; and R = 2-18C alkyl or alkoxy. 2-14C alkylenyl containing one or two double bonds, cyclobuttyl, cyclopentyl, cyclopentyl containing one or two double bonds, cyclobuttyl, cyclopentyl, cyclopentyl optionally monosubstituted with a 1-5C straight or branched chain alkyl group, or benzyl. The peptides Aba37001-B37058 represent examples of the peptide portion of the conjugate. The peptides represent analogues of a Bcl-2 superfamily polypeptide corresponding to amino acids 72.97 of

This sequence represents the murine bcl-x(L)/bcl-2 associated death promoter (Bad) gene. Bad is a 22.1 kD protein which interacts with bcl-2 promoter (Bad) gene. Bad is a 22.1 kD protein which interacts with bcl-2 proteins and regulates cell death. It has bomology to the bcl-2-related family clustered in the Bill and Bill domain. Bad has been found to hybridise to bcl-x(L) and bcl-2 in yeast two-hybrid assays and in vivo in mamalian cells. Overexpressed Bad counters the ceath inhibitory activity of bcl-x(L), but is much less effective at a conterring the death inhibitory activity of bcl-x(L), and its also counters the accelerate apoptotic cell death induced by cytokine deprivation in an IL-3 dependent cell line expressing bcl-x(L), and its also counters the centh repressor activity of bcl-x(L). Bad competes with bax for binding to bcl-x(L). Bad may be used to identify agents which inhibit its binding to bcl-2 or bcl-x(L) to form heterodimers. Such agents may be a block of the processing but the processing but the processing but the processing bol-x(L) and its also counters the counter of the bcl-x(L). Bad may be used to identify agents which inhibit its binding to bcl-2 or bcl-x(L) to form heterodimers. Such agents may be also because the bol-x(L) and block and brock  Murine; mouse; BCL-XL/BCL-2 associated cell death regulator; BAD protein; serine substituted mutant; apoptosis; cancer; viral infection.

The present invention describes mutant BAD (BCL-XL/BCL-2 associated cell death regulator) proteins, having an amino acid other than Ser at position 112 and/or 136, relative to the murine BAD 204 as sequence. The present sequence is the murine BAD protein. Also described are: (1) fragments of mutant BAD protein. Also described are: (1) fragments of mutant BAD with a heterologous polypeptide that increases intracellular delivery. Mutant BAD proteins are used to treat or prevent diseases associated with reduced apoptosis, e.g. cancer, viral infection, lymphoproliferation, arthritis, infertility, infertility, infamiliaring and autoimmune disease. Polyrucideotide sequences entitle annuals for use as disease models or in first infertility or proteins can be used similarly by gene therapy or to produce transgenic animals for use as disease models or in fung screening. BAD proteins phosphorylated at specified sea are used to screen for enhancers and inhibitors of serine-phosphatase. Inhibitors are potentially useful in treatment of excessive apoptosis such as AIDS, neurodegeneration, determined by measuring relative amounts of phosphorylated and nonphosphorylated BAD, by usual immunossays, Mutant BAD proteins have greater death-promotting activity than wild-type BAD brich can become phosphorylated on the specified Ser, forming a product that does not heterodiments with BCL-SL but instead binds to 14-33 family, heterodiments with BCL-SL but instead binds to 14-33 family.

CC (Bc1-X1/Bc1-2 associated cell death regulator). The serine residue is phosporylated in a post-translational modification and allows binding cc to the 14-3-3 protein which is a signal transduction regulator.

CC of a phosphoserine phosphatase, are useful for preventing/treating cc increased/decreased apoptosis in a cell. The increased apoptosis may cresult from immunodeficiency disease, senescence, neurodegenerative disease, ischaemic cell death, reperfusion cell death, infertility and wound-healing. Decreased apoptosis may result from cancer, viral cc infection, lympoproliferative conditions, arthritis, infertility, inflammation and autoimmune diseases. Measuring the amount of phosphorylated compared to unphosphorylated BAD polypeptide and/or total cc bab in a cell is useful for determining the apoptotic state of a cell. XX

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Can reverse the but not that of Bol-2. th factor receptor signaling | c and the apoptotic pathways with the anti-apoptotic proteins, Bcl-x(1), Bcl-2 and Bcl-w. Also binds protein S100A10 (By similarity).  x(1), Bcl-2 and Bcl-w. Also binds protein S100A10 (By similarity).  CC x(1), Bcl-2 and Bcl-w. Also binds protein S100A10 (By similarity).  CC -1 SUBCELUIAR LOCATION: Outer mitochondrial membrane. Upon phosphorylation, locates to the cytoplasm.  CC -1 DOMAIN: Intact BH3 domain is required by BIK, BLD BAK, BAD AND BAX for their pro-apoptotic activity and for their interaction with anti-apoptotic activity and for their interaction with anti-apoptotic members of the Bcl-2 family.  CC -1 PTM: Phosphorylated on Ser-112 in response to survival stimuli.  CC vir PTM: Prosphorylated on Ser-112 in response the percodimerization with 14-3-3 proteins. This interaction then facilitates the phosphorylation at Ser-155, a site within the BH3 domain, leading to the release of Bcl-x(1) and the promotion of cell survival.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

                                       their interaction with Bel-w in sympathetic neurons.";

their interaction with Bel-w in sympathetic neurons.";

Mol. Cell. Neurosci. 7:39-106(2001).

-!- FUNCTION: Promotes cell death. Successfully competes for the binding to Rel-Kil, Bel-s and Bel-w, thereby affecting the level of heterodimerization of these proteins with BAX. Can reverse the death repressor activity of Bel-Kil, but not that of Bel-2 (By similarity). Appears to act as a link between growth factor receptor signaling and the apoptotic pathways.

-!- SUBGNUT: Forms heterodimers with the anti-apoptotic proteins, Bel-Xil, Bel-2 and Bel-w. Also binds protein S100AlO. The Ser-113/Ser-137 phosphorylated form binds 14-3-3 proteins.

-!- SUBGELIULAR LOCATION: Outer mitochondrial membrane. Upon phosphorylation, locates to the cytoplasm (By similarity).

-!- ATTERNATIVE PRODUCTS:
   S->A: NO HETERODIMERIZATION WITH 14-3-3
PROTEINS NO EFFECT ON HETERODIMERIZATION

   The invention relates to a peptide conjugate having the formula: (R-X)n-peptide where n=1-10; X=C^{-}O, when the R-X group is attached to the N-terminus of the peptide, or a side chain of the peptide where the functional group of the side chain is NH2 or OH; or X=O or OH, when the R-X group is attached to the C-terminus of the peptide, or a side chain of the peptide, where the side chain functional group is COH or OH 
  This sequence represents the BH3 domain of human BAD.

The invention relates to a bcl homology domain 3 (BH3 domain),
derived from a prospotite member of the BCL-2 family. The
BH3 polypeptide can be used in a method for promoting apoptosis in a
target cell, especially where the cell is a cancer cell a virus infected
cell or an autoantibody producing cell. The BH3 polypeptide can be used
in therapeutic compositions for treating disease including cancer, other
lymphoproliferative conditions, arthritis, inflammation, and autoimmune
diseases, which may result from the down regulation of cell death

phenyl optionally monosubstituted with a 1-56 straight or branched chain the periodes provided with a 1-56 straight or branched chain always group, or benzyl. The peptides Aa33701-B37058 represent examples of the peptide portion of the conjugate. The peptides represent amalogues of a Bc1-2 superfamily polypeptide corresponding to amino acids 72-97 of the BH3 domain of the cell death agonist Bad. The peptide conjugate is useful for modulating apoptosis in the cells of a subject, or for reversing B cell lymphoma/lenkemia 2 (Bc1-2)-mediated blookage of reversing B cell lymphoma/lenkemia 2 (Bc1-2)-mediated blookage of subject afflicted with a cancer cells. It is also useful for inhibiting Bc1-2 function. In particular, the peptide conjugate is useful for treating a subject afflicted with a cancer characterized by cancer cells that capted so the cancer includes prostate, colorettal, gastric, on small lung, renal or thyroid cancers, neuroblastoma, melanoma, or acute or chronic lymphocytic and non-lymphocytic leukemia. The peptide conjugate is also useful for treating disorders acquired increased apoptosis, e.g. neurodegenerative disorders, acquired immunodeficlency syndrome (AIDS), stroke or myocardial infarction.

   This invention relates to a novel mutant protein which is derived from a wild type human BCl-2 protein. The mutant is created by replacing a sequence of amino acid residues comprising a flaxible loop from the wild type BCl-2 protein with an amino acid sequence comprising at least two acidic amino acids. The mutant BCl-2 protein comprises a 166 residue shown in the specification. The invention also comprises an assay for identifying substances that bind to the BCl-2 protein. The protein sequences of the invention are useful in biological assays to identify substances that block the ability of BCl-2 to inhibit programmed cell

This invention relates to a novel mutant protein which is derived from a wild type human BCl-2 protein. The mutant is created by replacing a sequence of amino acid residues comprising a flexible loop from the wild type BCl-2 protein with an amino acid sequence comprising at least two acidic amino acids. The mutant BCl-2 protein comprises a 16 residue shown in the specification. The invention also comprises an assay for identifying substances that bind to the BCl-2 protein. The protein sequences of the invention are useful in biological assays to identify substances that block the ability of Bcl-2 to inhibit programmed cell death or apoptosis. The present sequence represents a human Bcl2

   The present invention relates to new peptides that are derived from a wild-type human Bad peptide and are able to bind to a member of the Bol-2 protein family. The peptides are useful, when labelled, in competitive/displacement assays for identifying substances that bind to members of the Bol-2 family and may induce or suppress apoptosis so are potentially useful for treating cancer (inducers) or degenerative diseases or ischemic injury (suppressors). The peptides of the invention have high helix propensity, maintain the contacts of the wild-type Bad peptide and, compared with the Bad peptide, may have better physical properties, particularly solubility. The present sequence represents one of a collection of Bad peptides (AAU78601-AAU78631) that were derived from the BH3 domain of the human wild-type Bad peptide.
  New derivatives of Bad peptide, useful for identifying compounds that bind to Bol-2 proteins, potential agents for treating cancer and

The present invention relates to new peptides that are derived from a wild-type human Bad peptide and are able to bind to a member of the Bel-1-2 protein family. The peptides are useful, when labelled, in competitive/displacement assays for identifying substances that bind to members of the Bel-2 family and may induce or suppress apoptosis so are potentially useful for treating cancer (inducers) or degenerative diseases or ischemic injury (suppressors). The peptides of the invention have high helix propensity, maintain the contacts of the wild-type Bad peptide and, compared with the Bad peptide, may have better physical properties, particularly solubility. The present sequence represents one of a collection of Bad peptides (AAU78601-AAU78631) that were derived from the BH3 domain of the human wild-type Bad peptide.

   This invention relates to a novel mutant protein which is derived from a wild type human BC1-2 protein. The mutant is created by replacing a sequence of amino acid residues comprishing a flathible loop from the wild type BC1-2 protein with an amino acid sequence comprising at least two acidic amino acids. The mutant BC1-2 protein comprises a 166 residue shown in the specification. The invention also comprises an assay for identifying substances that bind to the BC1-2 protein. The protein sequences of the invention are useful in biological assays to identify substances that block the ability of BC1-2 to inhibit programmed cell death or apoptosis. The present sequence represents a human BC12
members of the Bcl-7 family and may induce or suppress apoptosis so are potentially useful for treating cancer (inducers) or degenerative diseases or ischemic injury (suppressors). The peptides of the invention have high helix propensity, maintain the contacts of the wild-type Bad peptide and, compared with the Bad peptide, may have better physical properties, particularly solubility. The present sequence represents one of a collection of Bad peptides (AMU78601-AAU78631) that were derived from the BH3 domain of the human wild-type Bad peptide.

comprising at least a first functional molecule covalently linked to a second functional molecule, which is able to modulate the activity of the permeability transition pore complex (PTPC) of the mitochondria.

(I) has the function of specifically targeting and entering a tissue cell population. The second functional molecule has the function of specifically targeting and inducing or preventing the death of the cells by apoptosis by regulating the opening or the closing of the PTPC of the mitochondria or its fragment. (I) has virucide, neuroprotective, vasctropic and cytostatic activities, and can be used as a mitochondrial permeability transition pore complex (PTPC) modulator. (I) is useful for regulating call death regulatory molecules, specifically the apoptogenerative diseases, inhimant hepatitis or viral infections.

The present sequence represents a PTPC-interacting TOX peptide which is

  SIMILARITY: Contains 1 Bc1-2 homology 3 (BH3) domain.
SIMILARITY: BELONGS TO THE BCL-2 FAMILY.
CAUTION: Ref.1 sequence differs from that shown due to frameshifts in position 64 and 91.

  14.37 proceins and survival kinases cooperate to inactivate bath by most cell 6:41-51(2000).

15. Cell 6:41-51(2000).

16. Cell 6:41-51(2000).

17. FUNCTION: Promotes cell death. Successfully competes for the binding to Bcl-x(L), Bcl-2 and Bcl-w, thereby affecting the level of heterodimerization of these proteins with BAX. Can reverse the death repressor activity of Bcl-x(L), but not that of Bcl-2.

16. Submary: Forms heterodimers with the anti-apoptotic proteins, Bcl-2 and Bcl-w. Also binds protein 5100AlO (By similarity).

17. Submary: Forms heterodimers with the anti-apoptotic proteins. Bcl-3 and bcl-w. Also binds protein 5100AlO (By similarity).

18. Ser-112/Ser-136 phosphorylated form binds 14-3-3 proteins.

19. DOMAIN: Intact BH3 domain is required by BIK, BID, BAK, BAD AND BAX for their pro-apoptotic activity and for their interaction with anti-apoptotic members of the Bcl-2 family.

19. Subsequent phosphorylation on Ser-112 in response to survival stimuli.

19. Subsequent phosphorylation on Ser-1136 promotes heterodimerization.

Yang E., Zha J., Jockel J., Boise L.H., Thompson C.B., Korsmeyer S.J.;
Bad, a heterodiameric partner for Bcl-XL and Bcl-2, displaces Bax and promotes cell death.";
Cell 80:285-291(1995).
  with 14-3-3 proteins. This interaction then facilitates the phosphorylation at Ser-155, a site within the BH3 domain, leading to the release of Bcl-x(L) and the promotion of cell survival. Ser-136 is the major site of AKYPKB phosphorylation, Ser-155 the major site of protein kinase A (CAPK) phosphorylation.

"ISSUE SPECIFICITY: Expressed in all tissues tested, including brain, liver, spleen and heart. In the brain, restricted to epithelial cells of the choroid plexus. Isoform alpha is the more abundant form.

-!-DOMAIN: Intact Blaid domain is required by BIK, BID, BAK, BAD AND BAX for their pro-apoptotic activity and for their interaction with anti-apoptotic members of the Bcl-2 family.

-!-DAMAIN: Intact Blaid domain is required by BIK, BID, BAK, BAD AND BAX for their pro-apoptotic activity and for their interaction with anti-apoptotic members of the Bcl-2 family.

Subsequent phosphorylation on Ser-113 in response to survival stimuli. Subsequent phosphorylation on Ser-137 promotes heterodimerization with 14-3-3 proteins. This interaction then facilitates the phosphorylation at Ser-166, a site within the BH3 domain. leading to the release of Bcl-x(L) and the promotion of cell survival.
